Examiner, Art Unit 3767

U.S. Patent and Trademark Office

Supervisory Patent Examiner, Art Unit 3767

Continuation of 11, does NOT place the application in condition for allowance because: The examiner has reviewed Applicant's arguments, but have not found them persuassive. With regards to Applicant's arguments that the cathetter becan to contact the guidewire stop due to the filter located between the two elements, the examiner would like to point out that the claim language does not require that the catheter's distal ip abut the guidewire stop, if merely requires a guidewire with a distal stop. With regards to Applicant's arguments that the examiner is misidentifying the guidewire lumen (Applicant asserts that it is labeled as 7 in Fig. 9), the examiner agrees that a portion of the guidewire lumen is 7, however the distal portion of the guidewire lumen, such as the portion that 202 surrounds, is much smaller in diameter and is approximately the diameter of the guidewire passing through it. With regards to Applicant's arguments that it is not the function of the Griffin device to invert proximally into the lumen, it is still the examiner's position that if the distal tip of the catheter abuts a surface with a high enough force to deform the distal tip of the catheter, the distal tip of the catheter is capable of inverting proximally into the lumen (inverting into are a 13 for example). The examiner suggests adding more structurel mil anguage, perhaps with regards to the structre and shape of the distal end of the catheter which allows the catheter to invert proximally into the lumen during routine use.
